ABSTRACT

The primary research emphasis of School to College: Opportunities for Post Secondary Education (SCOPE) is to analyze and report the interrelationships of yearly data in such ways as to help answer questions about why different students behave and believe as they do, and how these actions and attitudes influence the decision-making process. For this study, eleventh grade students from four states completed a questionnaire. Several new areas of student life were investigated in this report. Among these are guidance contacts with counselors and teachers about work, and information about counselors and teachers. Students also used a series of 20 role behaviors to describe themselves in three different situations: (1) at home, (2) at school, and (3) with friends. For each item response in this grade 11 report, it is possible to observe similarities and differences between the sexes, across aspiration groups, and among the four states. One noted conclusion was that grades as an incentive to learning are more attractive to girls than to boys. Complete data tables are presented according to student response to the questionnaire. SCOPE Profile: Selected Items, 1968 Grade Eleven Questionnaire	2

Introduction

Discovering the decision-making patterns among high school students—the ways in which they acquire information about colleges and vocations; the nature and relative importance of parental, school, and general community influences on their decisions; and when various stages in the decision-making process occur—is the main emphasis of SCOPE (School to College: Opportunities for Postsecondary Education). This seven-year study, involving almost 90,000 students in four states, is formally sponsored by The Center for Research and Development in Higher Education and the College Entrance Examination Board.

This is the fourth in the SCOPE series of annual state profiles. SCOPE's primary purpose in making these reports available is to share with the institutions and agencies cooperating in the project the first analyses made of students' questionnaire responses. However, these annual state profiles from the four project states—California, Illinois, Massachusetts, and North Carolina—are proving of value to educators across the country, as well as to the principals, counselors, and teachers whose students are making SCOPE possible.

Sampling, Samples, and Schools

The four state profiles included in this grade eleven series report data only on those grade nine students from the original state samples who were tested in the same state in grade ten during 1967 and remained in the same state to be tested in grade eleven. Students who had moved to other states were located and tested whenever possible, but data on these students are not included here. These students remain subjects in the SCOPE project and will be included in longitudinal studies reported in the future. Grade-eleven data are available for 76.8 percent of the students from the original grade-nine samples. Data on about 5 percent of the original samples are not included in the present profiles because they were received too late or came from out-of-state students. Data reported here are for the following percentages of grade nine students of 1966 who were tested in grade eleven in the original project states: California, 72.3 percent; Illinois, 76.0 percent; Massachu-

setts, 79.3 percent; and North Carolina, 65.7 percent. Students were lost from the project because they dropped out of school, or because they or their school failed to cooperate, or because SCOPE failed to locate them after they had moved. Studies to differentiate these subgroups of missing students are under way in order to determine whether or not any bias exists in project findings.

Determining the Sample Size

The original samples drawn from the four project states were generally representative of the state populations of public and private school students with regard to several important characteristics. The basic sampling unit, because of administrative advantages and economical use of resources, was the individual school.

The major focus of SCOPE is on the progression of students through high school into their second semester of college. In order to insure an adequate amount of data for analyses at the end of the project, four factors were taken into consideration in determining the initial grade nine sample sizes: the number of students needed for the most complex analyses (approximately 4,000 students per state); the persistence rates of students through each year of schooling; the college-going rates in each of the four states; and, finally, a general persistence rate during the first year of college.

Calculations based upon the above considerations resulted in the following theoretical sample sizes: California, 8,204; Illinois, 14,338; Massachusetts, 11,673; and North Carolina, 21,846. The sample sizes were later defined as the number of students who were actually tested in the spring of 1966. The actual sample sizes, then, were: California, 9,836; Illinois, 13,223; Massachusetts, 7,501; and North Carolina, 15,552.

Selection of Counties and Schools

Once the required initial sample sizes were calculated, the next steps were to determine how and from where the students were to be drawn for the samples. A multistage, stratified, proportional random-sampling procedure was used.

The counties in each of the states were statistically grouped into similar clusters on the basis of common characteristics. Several of the characteristics taken from the 1960 census data and recent school data were: median family income, percent of white collar workers, white and nonwhite populations, mobility of the population, rate of school attendance of school age children, school size, and ratio of high school graduates to students who go to college. Counties were then randomly selected from within each cluster of counties in each of the four states. School districts, and then schools, were randomly chosen from within the selected counties.

Because individual schools were chosen as the units of sampling, it was only possible to approximate samples of the desired size. When a school became part of the project, all grade nine students were requested to participate. On the average, approximately 93 percent of the students cooperated. As indicated above, the samples were redefined on the basis of the students actually tested.

A source of bias may be the loss of certain metropolitan school districts in California, Illinois, and Massachusetts. However, adjacent alternative schools volunteered in California and Illinois and have become part of the SCOPE project. It would appear that proper representation of these areas in two states has been reestablished.

In Massachusetts, the public schools in a large metropolitan area that chose not to participate were not replaced by other volunteer schools. Thus the public school systems are underrepresented. However, there should be considerable confidence that these data—because of the size of the samples and the range of the types of schools involved—reflect the attitudes, abilities, and interests of a rather remarkable cross section of youth in the public and private schools of the SCOPE states. Specifically, 244 public and 55 nonpublic schools in the four states originally participated in the SCOPE project. Many other schools are now involved, as some original SCOPE students move within their states or to other states. In 1967, 1,205 public and private schools had SCOPE students in attendance, and in 1968 this number increased to 1,802.

Focus of SCOPE

It is the hope of the College Board and The Center for Research and Development in Higher Education that the state profiles and the more substantial publications to follow will be useful in a time of great educational change. In the years to follow, SCOPE findings will constitute more than an accumulation of descriptive profiles at each grade level. These yearly reports should be viewed as intermediate products of the project. Such descriptive reports help to describe important subgroups of students at a particular grade level and, when viewed in relationship to earlier or subsequent profiles, may suggest trends in student attitudes and behavior as they move through school into postsecondary education and the world of work. These reports may also stimulate or supplement local studies of students.

The primary research emphasis of SCOPE is to analyze and report the interrelationships of these yearly data in such ways as to help answer questions about why different groups of students behave and believe as they do, and how these actions and attitudes influence the decision-making process. Knowledge about the timing, strength, and constancy of students' behaviors and aspirations in relationship to the expectations of significant persons in their lives seems central to understanding the process of making educational and career decisions.

Certainly decisions about education and career are associated with personal and family-background characteristics of students. However, decisions that young people make about education after high school are clearly influenced by the opportunities available to them. In order to understand the influence of these opportunities better, SCOPE chose four states that have differing traditions regarding public and private education and differing state plans and systems for education beyond high school. It is anticipated that these differences in the nature of educational opportunities will help explain the decisions young people make about education and work.

A fundamental objective of SCOPE will be realized if such understanding contributes to increased educational

opportunities beyond high school, as well as to changes in school and home environments that will stimulate and be hospitable to decisions that maximize student potential and that are increasingly self-directed.

Previous Reports

1966 Grade Nine and Grade Twelve Profiles

In 1967, a set of state and school reports were widely distributed in cooperation with the College Entrance Examination Board. These reports presented, in profile form, responses by boys and girls to questionnaires administered in the spring of 1966. These earlier reports provide essential information about SCOPE objectives. The SCOPE staff is using apparent trends in the data from these reports in designing new questionnaires, methods of longitudinal analyses, and future publications.

1967 Grade Ten Profile

In 1968, a set of state and school reports was distributed in cooperation with The Center for Research and Development in Higher Education. These reports presented in cross-tabulation form responses by boys and girls to 52 selected items from a questionnaire administered in the spring of 1967. The format of these reports is different from the earlier profiles in that they present data about 10 subgroups of students, separated according to sex and according to five levels of educational aspirations indicated by the students at the time they answered the questionnaire.

Future Publications

Studies of the 1966 Seniors

Two sources of data will be used for studying and reporting about the postsecondary experiences of the approximately 35,000 high school seniors who participated in SCOPE in 1966. First, many of those young people who went to college or to special schools after high school answered an extensive questionnaire that emphasized evaluation of college experiences, a look back at both high school prep-

aration and planning, and a look ahead in reference to continuing their education and choosing a career. Second, parents of these graduates of 1966 were asked to respond to a brief questionnaire about what these students did after they left high school and about family financial resources, expenditures, and needs resulting from having children in college. These data from parents will provide both validation of students' reports and additional information about students and their families. They will also be used in conjunction with findings from the 1966 twelfth-grade questionnaire in seeking understanding of what actually happened to these students in the light of the attitudes and behavior reflected in their questionnaire answers. Two reports are planned for publication in 1969.

The first will be a report describing the kinds of post-secondary education institutions attended by the 1966 seniors. It will emphasize the characteristics of groups of students who had similar educational experiences after they graduated from high school. The location, degree level, and type of control of institutions attended will be analyzed in reference to such variables as student's ability, occupational aspiration, and intellectual predisposition; father's occupation and family's income; and student's use of guidance services.

The second report will be restricted to those students who answered the college questionnaire in 1967. It will examine the aspirations of these students as high school seniors in the light of their experiences in college. The report will also focus on the "fit" or relevance of the colleges chosen by these students by comparing the way students described the colleges and the way they described themselves. Both reports should be of value to school counselors and administrators as well as to college deans and admissions officers.

Studies of 1966 Freshmen as Seniors

By spring 1969, the SCOPE freshmen of 1966 will be on the verge of leaving high school either to enter an institution of higher education, to seek employment, to begin homes of their own, or to serve in the military. To be sure, some students engage in more than one of these activities. Once

again the SCOPE staff will seek special cooperation of students and schools in order to collect extensive data at this crucial period of decision making. The earlier findings from the project show clearly that most students—particularly those of modest achievement and from families of relatively low socioeconomic status—make decisions about what they will do after high school during their final year of schooling. However, about 15 percent of the sample probably will still not know what they will do after leaving school. This is the time, then, for a major reassessment of the SCOPE students who were first tested as freshmen in 1966. This reassessment also represents an opportunity for numerous comparisons with those students from the same communities and schools who graduated from high school in June 1966. Approximately two class hours will be needed for this data collection. Again, descriptive state reports will be shared with schools in the winter of 1969.

Studies of 1966 Freshmen as College Goers

In the fall of 1969, some 55 percent of the SCOPE students from the four project states are expected to enter some postsecondary institution. In cooperation with the schools and colleges of the country, efforts will be made to locate these students. Further investigation in the spring of 1970 will provide additional information about how students evaluate their postsecondary choices and their high school experiences in the light of these decisions. Attention also will be given to the aspirations and plans they have for the future. A final cross-sectional report on these college-going students will be published in the winter of 1970.

Longitudinal Studies

By spring 1970 SCOPE will have collected data on the original 1966 high school freshmen during each of their years in high school and at the end of their first year after high school graduation. A number of studies will be done that fit together findings from across the five years of SCOPE. A series of publications will result from the longitudinal studies.

Content of This Report

The list of tables at the end of this Introduction describes each of 69 variables selected from the Grade Eleven Questionnaire and shows the relationship between table number and original item number in the questionnaire. These variables, which are analyzed according to students' educational aspiration, might be clustered into two main groups: longitudinal items and new items.

Longitudinal Items

For the purpose of assessing change over time, data have been collected annually about student achievement (Tables 35-37), values (Tables 18-22), time invested in certain activities (Tables 23-25), occupational preference (Tables 64 and 67), course interests (Table 29), and guidance from school personnel about college (Tables 57 and 58). Even though certain of these items are parallel from year to year, caution should be used in direct comparison of the annual cross-sectional samples because of possible bias resulting from students' dropping out of school or not participating in the study for other reasons.

New Grade Eleven Items

Several new areas of student life were investigated in the Grade Eleven Questionnaire. Those selected for this profile can be grouped as follows:

- (1) Extracurricular activities with friends (Tables 2-17).
- (2) Information about counselors and teachers (Tables 27, 28, and 30-33).
- (3) Guidance contacts with counselor and teacher about work (Tables 60 and 61).
- (4) Student perceptions of college (Tables 38-45).
- (5) Barriers to college education (Tables 46-54).
- (6) College major (Table 69).

Another type of variable was present in the Grade Eleven Questionnaire, but it is not included in this report. Students used a series of 20 "role behaviors" to describe themselves in three different situations: "At Home," "At School," and "With Friends." They also described their

parents, counselors, teachers, and peers in reference to these same behaviors. These data will be of most interest when students' self-descriptions in the three different situations are compared, and when these self-descriptions are compared with those of significant others. Since these analyses require a format considerably different from that of the present profile, they will be given in a special report.

Format of This Report

In the tables given in this report, students are grouped according to two variables. First, the items have been analyzed separately for boys and girls. Second, each item has been analyzed and reported according to how long these students, as eleventh graders, say they expect to stay in school. The five levels of educational aspiration are: (1) leave school as soon as possible; (2) graduate from high school; (3) attend junior college or some special technical-vocational school; (4) graduate from a four-year college; and (5) seek a postgraduate degree. It is apparent from the analyses of these aspiration levels that they are highly correlated with students' achievement and with the socioeconomic level of their families. It would seem, therefore, that these five aspiration levels are useful ways of displaying to school people important differences among groups of students.

Each table in this report presents the question that was asked of students in the questionnaire and then lists the response categories immediately below the question. The columns to the right of each response category give the response frequencies (N) and percentages (PC) for each subgroup of students. There are five educational aspiration groups for each sex and therefore 10 subgroups for each possible response. The student responses from all four states are grouped together for every question so that comparisons can be made of the subgroups of students across the four states.

Rationale for Selection of Student Subgroups

One of the greatest enigmas facing educators is understanding how the process of making educational and

career decisions varies for different groups of students. One purpose of this report is to enable school personnel and other interested educators to join the SCOPE staff in examining the similarities and differences in the subgroups of SCOPE students as eleventh graders.

As explained previously, students have been grouped according to sex, educational aspirations, and state. Why have these particular variables been selected as "controls"? Other research has demonstrated that boys and girls differ in both psychological and sociological characteristics. Educational aspiration can be called a psychological factor. This variable is of particular interest because it appears to link the past with the present (as suggested by its association with family background) as well as the present with the future (as suggested by its association with students' actual postsecondary choices). The state in which a student attends school can be called a sociological factor. The states surveyed in the SCOPE study were selected because of their differing systems of higher education. One part of the SCOPE study will be to compare data on students in the four project states in order to generate hypotheses concerning the differential impact these systems make on channels of access to higher education, and indirectly on student development.

Ways of Using This Report

It is a commonplace that the information obtainable from tables such as the ones in this report largely depends on what one is looking for and how he goes about it. Some people ignore similarities they observe for subgroups of students, or view them with disappointment because they think that an item is not a "good" one unless it shows up differences. But the similarities among students should hold as much meaning for educators as the differences. Enlightened educational planning usually starts from the common core of characteristics shared by students and proceeds from that to the special interests and needs of different kinds of students.

The necessity for seeking out the interplay of similarities and differences among student groups is well illus-

trated by a series of items relevant to school learning. Comparison of *all* ("total") California boys and *all* girls in Tables 23, 35, and 36 shows that girls study more, aspire to higher grades, and expect to receive higher grades than boys do. Can it be inferred from these findings that girls actually have more interest in school learning than boys do? Table 20, reporting data on the importance students assign to school learning, shows that the responses of boys and girls were about the same. These findings argue against the interpretation that boys are less interested in learning than girls are. Rather, they suggest that grades as an incentive to learning are more attractive to girls than to boys.

For each item response in this grade eleven report it is possible to observe similarities and differences between the sexes, across aspiration groups, and among the four states. These comparisons can probably best be made by observing first the ways in which all boys and all girls in a single state responded to certain questions, comparing these responses with those of all boys and all girls in each of the other three states, and then investigating the similarities and differences among the five educational aspiration groups.
